FOR IMMEDIATE RELEASE

New Generation in Thermal Packaging Solutions Introduced *Minnesota Thermal Science Launches Credo™ Brand Products and Services*

Minnesota Thermal Science (MTS) has broadened both depth and scope of its services through a significant product line expansion. After more than five years of product enhancements and rigorous, scientific testing, MTS has announced the launch of Credo™, the new industry standard in thermal solutions.

The Credo line, named for the Latin word meaning ‘trust,’ encompasses the company’s current best-selling products as well as such new market entries as the Credo Series 4-2168, which consistently maintains blood products and vaccines at 4°C for up to *seven days* – longer than any other option available. With such performance, the container can be shipped standard ground with no need for costly refrigerated transport.

Precise and reliable, MTS products provide unprecedented protection for thermally-sensitive materials. Superior performance is achieved by coupling state-of-the-art vacuum insulation panels with MTS’ patented Thermal Isolation Chamber, or TIC™ System, that surrounds critical contents with phase change material. Reusable Credo containers are proven to provide exceptional return on investment, as compared to outdated ice and gel pack options.

The patented Golden Hour® Technology, the backbone of Credo products, was originally developed to meet the extreme needs of the U.S. Army. Requiring guaranteed performance in temperatures ranging from the bitter cold of the Afghanistan mountains to the intense heat of Iraq’s desert, the MTS Original Golden Hour® Container, winner of the U.S. Army Greatest Inventions Award, is credited with saving lives and revolutionizing the methods used for transporting blood.

As testament to the reliability of this innovation, the technology has been validated by such high-profile organizations as Walter Reed Army Institute, U.S. Special Forces, British Ministry of Defense and many other industry leaders.

“MTS represents the new generation in thermal solutions, allowing companies worldwide to precisely and reliably maintain critical, temperature-sensitive materials for extended periods of time,” said Tom Anderson, CEO of Minnesota Thermal Science. “Whether used to transport critical research samples, on the battlefield or to deliver life-saving pharmaceuticals, our products are frequently referred to as the ‘universal solution’ for superior, cost-effective thermal performance.”

The new Credo line also encompasses expanded industry-specific services such as high-precision thermal lab testing; closed-loop container refurbishment; design consulting and prototyping; and essential implementation services that help companies seamlessly transport critical materials in demanding environments.
